

# Integration testing

- Component들이 통합되어 구성된 전체 시스템 혹은 서브시스템들을 시험하는 것.
- 통합 테스팅은 테스트들이 명세서로부터 유도된 **black-box** 테스팅이어야 함
- 주요한 어려움은 에러들을 지역화(localization)하는 것임.
- 점진적인 통합 테스팅이 이 문제를 줄여줌.

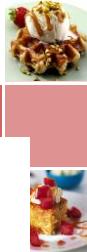

# Incremental integration testing

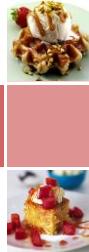

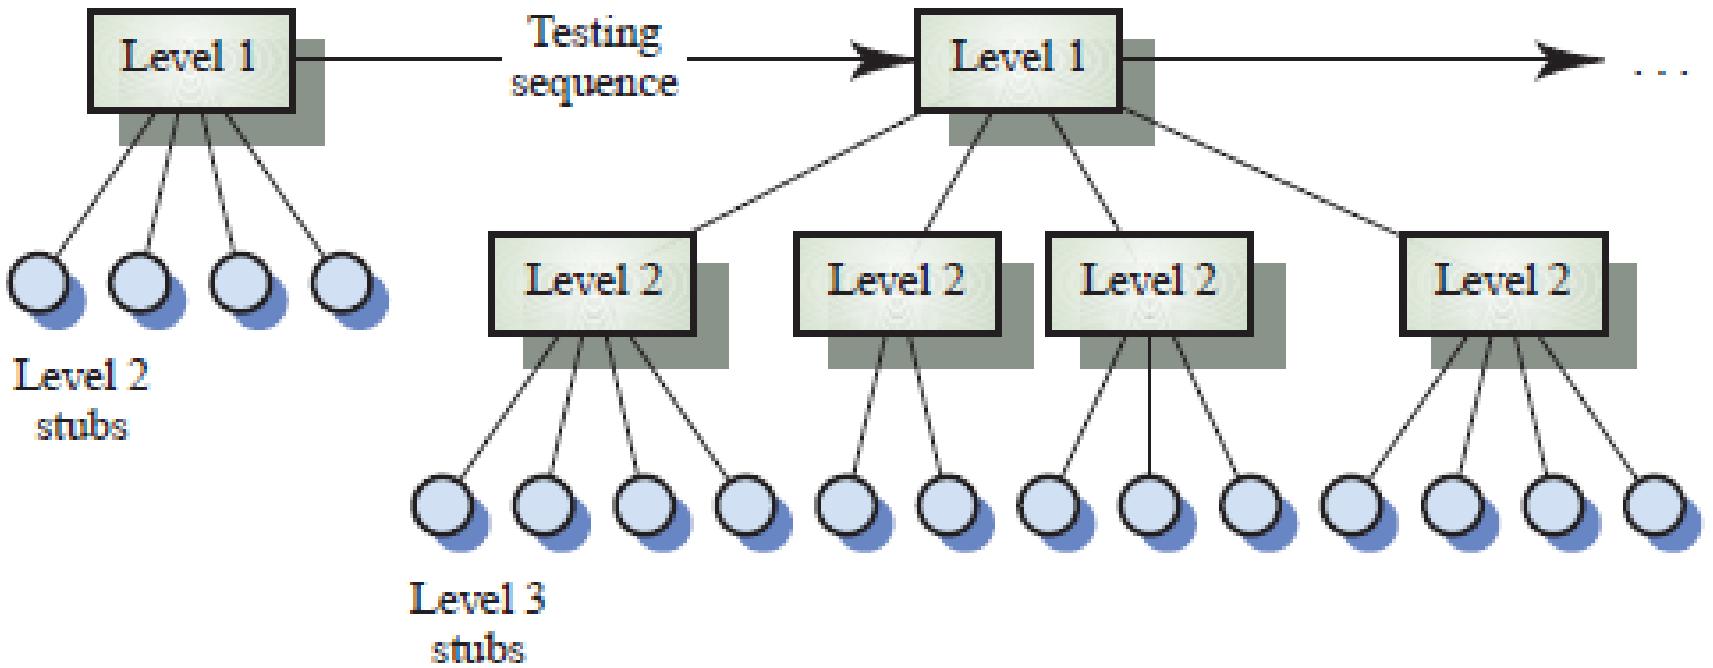

# Approaches to integration testing

---

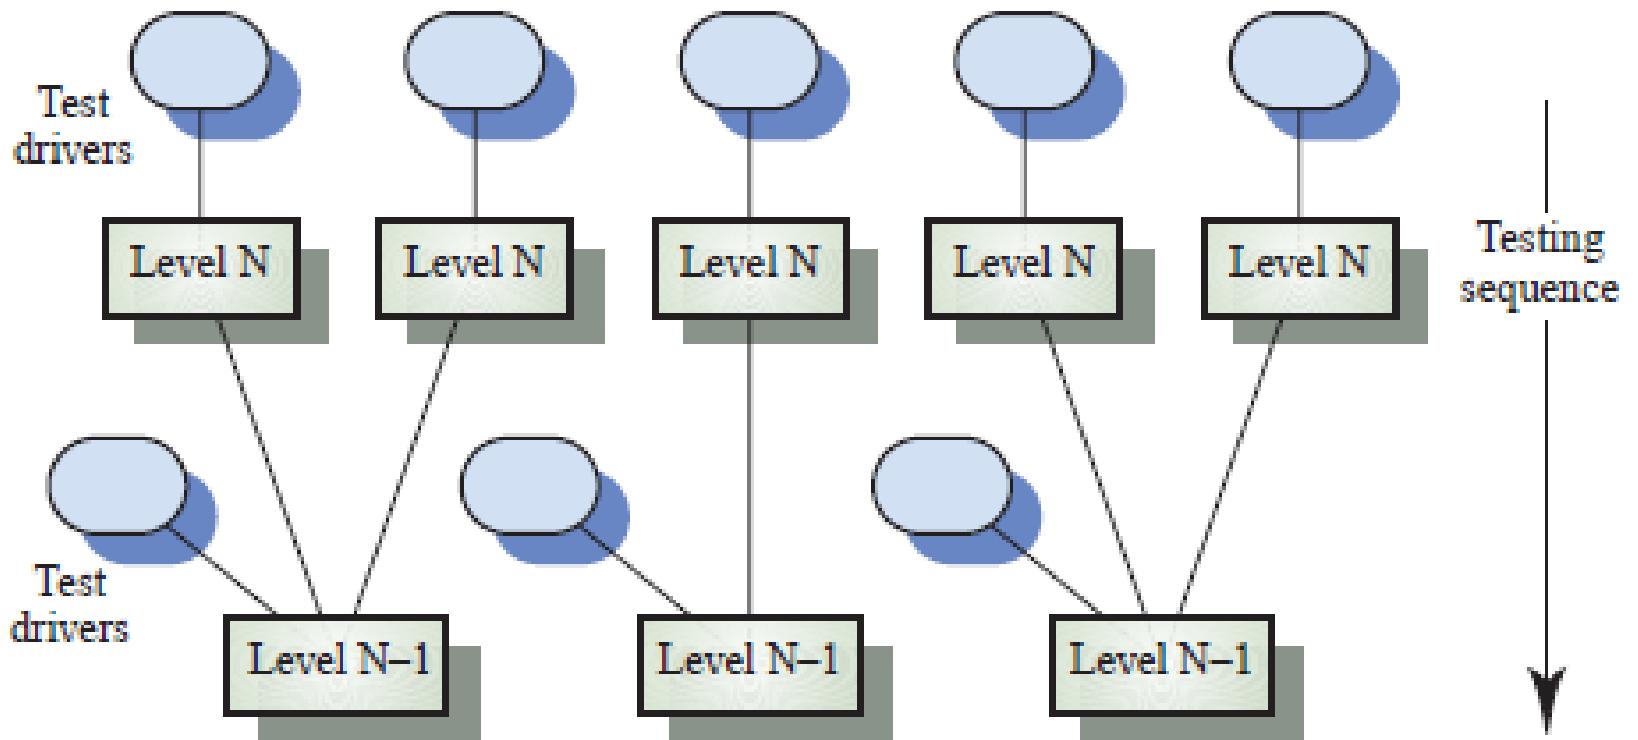

- Top-down testing
  - Start with high-level system and integrate from the top-down replacing individual components by **stubs** where appropriate
- Bottom-up testing
  - Integrate individual components in levels until the complete system is created
- In practice, most integration involves a combination of these strategies

# Top-down testing

# Bottom-up testing

# Testing approaches

---

- 구조 확인(Architectural validation)  
Top-down integration testing is better at discovering errors in the system architecture
- 시스템 증명(System demonstration)
  - Top-down integration testing allows a limited demonstration at an early stage in the development
- 테스트 구현(Test implementation)
  - Often easier with bottom-up integration testing
- 테스트 관측(Test observation)
  - Problems with both approaches. Extra code may be required to observe tests
